Star Wars data api to use: <http://swapi.co>

(See image for how the cards will look) Display movie cards that show 2 movies per card. For each movie, show:

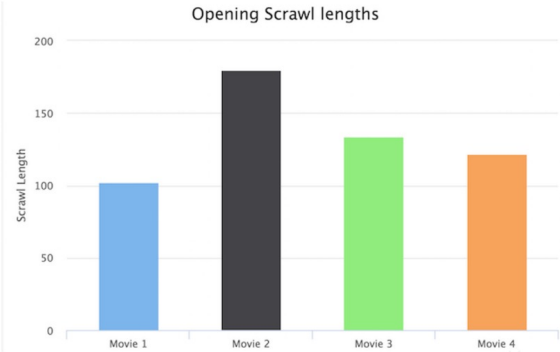

- the poster image,
- the title of the movie,
- the director,
- and 3 main characters.

If all cards don't fit on one line, they should wrap to a new line.

Create a separate side bar with these individual sections:

1. Your favorite Star Wars character
 2. Your least favorite character
 3. *A bar graph plotting the count of words in the opening crawl for each movie.
- The X-Axis will show the movie title. The Y-Axis will have the number of words. See attached example graph image.

Frameworks/Libraries to use

You can use whatever you'd like really. Express (Hapi, Koa, Restify, etc.), React, Vue, Angular, Bootstrap, whatever you think you need to use to build this small app. This is your chance to show us how you work. We're excited to see what you come up with. Good luck!
